

Accessibility and Disability Inclusion

Watch – Project Feedback

As part of the project, a dedicated accessibility and disability inclusion watch was conducted throughout the design and development phases.

This watch made it possible to better understand the challenges related to web and mobile accessibility, as well as the associated technical and regulatory constraints. The analysis of WCAG and RGAA standards highlighted the importance of integrating accessibility requirements from the earliest design stages in order to avoid costly corrections at the end of the project.

The findings of this watch directly influenced several technical and functional decisions, particularly regarding interface structure, navigation, readability, and user interaction management. Some initially considered technologies or approaches were excluded due to their limitations in terms of accessibility support.

This process also helped identify current project limitations, notably the absence of user testing involving people with disabilities. These limitations have been clearly identified as improvement areas for future project iterations.

In conclusion, the accessibility watch contributed to improving the overall quality of the project, strengthening its inclusive nature, and reducing accessibility-related technical debt. It provides a solid foundation for the maintenance and future evolution of the application in an evolving regulatory and technological context.
